

Actions to implement for more sustainable animation projects

Train as many people as possible

Sustainability is not a topic to be handled by only a few experts. The more people understand the impacts and the tools, the more consistent decisions become across the production.

Raise awareness at every level

Sustainability should be embedded across all teams. Shared knowledge helps improve daily decisions and supports more coherent productions.

Extend the lifespan of equipment

Choosing to maintain, repair, and extend the use of existing equipment, rather than systematically replacing it, significantly reduces emissions while also improving resource efficiency.

Appoint a responsible and empowered sustainability leader

Each project should appoint a sustainability lead with the expertise and authority needed to integrate sustainability into production decisions.

Work collectively with partners and suppliers

Animation projects rely on collaboration. Engaging partners and suppliers in a shared sustainability approach helps ensure consistency across the production chain.

Embed sustainability into company governance

Embedding sustainability into company strategy and management processes helps ensure continuity between projects and makes these practices part of the organization's core activities.

Communicate transparently

Communicating transparently about commitments and progress strengthens credibility and helps avoid misleading sustainability claims.
